

Id-entify version 1.2

Patent GB2312956.2 [August 2023]

01 October 2025

Introduction

Id-entify is a “zero knowledge proof” identity-validation provider. We validate personal and business transactions, remotely or in-person bypassing the need of sharing re-usable company / personal data.

We provide secure Government-id linked point of sale validations accompanied by tamperproof receipts, contracts and email signing.

A diagram is provided here - <https://bit.ly/4ioUMcW>

Abstract

Id-entify provides consumers and supply chains with **secure** two-way authorisations **remotely** and **in-person**, to phase-out open sharing of **reusable** data e.g. ‘**postcodes**’ and ‘**birth-dates**’ as authorisations.

Description

Companies and Individuals, set-up an Id-entify profile linked with a legal identity, then used to authorise future interactions between participants.

Users are presented in-app with an anonymous **one-time** passcode used as government-id-associated validation between transacting parties, leveraging blockchain-level tamperproof logs, receipts, warranties and auditing.

Id-entify provides screening and vetting validation of personally held certifications and professional clearances.

Identify enhances Blockchain asset ownership by directly linking crypto assets with id-entify profiles.
