Dear Minister

Wetland Drainage and Rewetting Activity - Greenhouse Gas Reporting

For your information, I enclose a copy of a letter that I have written to Greg Barker at DECC. In doing this, I am very much aware that the majority of the UK's peat resource lies in Scotland and therefore this is an issue of great importance to Scotland.

No doubt your department is in contact with DECC about this issue, and I hope that the Forum's support for the inclusion of wetland drainage and rewetting activity in our national greenhouse gas reporting will be helpful in securing this outcome. I believe that adopting this activity makes sense for peatland and therefore makes sense for Scotland.

Yours sincerely

16th November 2012

Dear Minister,

Wetland Drainage and Rewetting Activity - Greenhouse Gas Reporting

I am writing to you on behalf of Scotland's Moorland Forum to express support for the UK Government to include wetland drainage and rewetting activity in its greenhouse gas reporting under the next Kyoto Protocol commitment period.

I have been closely involved with the work of the IUCN UK Peatland Programme and the Commission of Inquiry on Peatlands, which had the support of Defra, public bodies, NGOs and land management interests. Whilst further scientific work is important, it is clear from the evidence in the UK and internationally that peatlands have a key role to play in climate change. Restoring peatlands is an urgent priority for helping to mitigate climate change as well as delivering biodiversity and water quality benefits.

Scotland's Moorland Forum currently has 29 member organisations (see below) and can claim to represent a broad range interests. Members have recognised that more must be done to address the problems facing our peatlands particularly under a changing climate. UK peatlands represent a huge carbon store; a loss of just 5% of this store would equate to the total annual greenhouse gas emissions from human activity in the UK.

The inclusion of wetland drainage and rewetting as a voluntary accounting activity under the Kyoto Protocol was an important global signal on the importance of peatlands and presents a huge opportunity to stimulate increased effort to manage peatlands and secure additional private funding to augment current public funds.

I understand that the UK Government has to inform the UN within the next month whether the wetland drainage and rewetting category will be included in our national greenhouse gas reporting under the next Kyoto commitment period. I would like to encourage you to take this option.

Although the science retains some uncertainty about the implications of adopting the wetland drainage option, there is strong support within the Forum for this move.

The inclusion of rewetting would give an important signal to the business community that peatland restoration is supported at the highest level for the contribution it can make to the achievement of climate change targets. Investment by the business community could bring much needed resources to fund more peatland restoration, and the location of extensive peatland areas means that this investment often takes place in remote and economically disadvantaged areas. There is considerable peatland restoration activity underway, which with current support from Defra is rapidly improving our scientific knowledge and should allow adequate reporting within the timeframe of the next commitment period.

I would be pleased to provide additional information if this would be of interest.

Yours sincerely

Lord Lindsay
Chairman
