

Calculations Policy

Year 6

SUBTRACTION

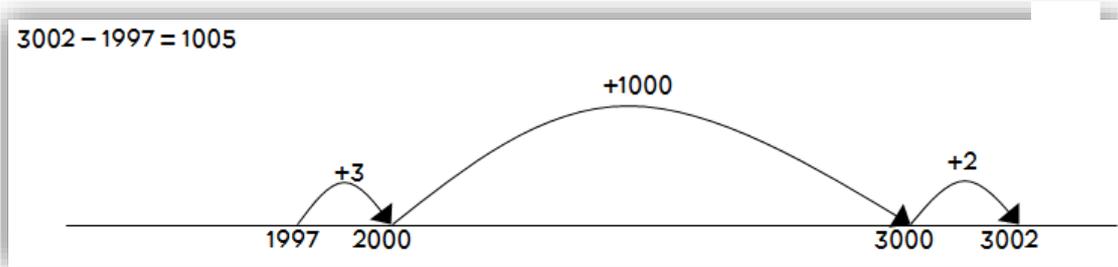

S.6 LARGER NUMBERS AND DECIMALS (4-5)

The method of decomposition can be extended to numbers of any size, including decimals.

Note: Where the numbers are involved in the calculation are close together or near to multiples of 10, 100 etc. counting on using a

number line should be used:

Remark: Children should be encouraged to consider if a mental calculation would be appropriate before using written methods.

MULTIPLICATION

M. 7. SHORT MULTIPLICATION (5-6)

Short multiplication is the most efficient method for multiplication by a single digit number. It should be taught with reference to the grid method for multiplication, using appropriate place value vocabulary, e.g. we multiply the eight units by seven, then the two tens.

A grid-based short multiplication problem. The numbers 28 and 7 are written in the top two rows. A horizontal line is drawn below the 28. The product 196 is written in the row below the line. A small '5' is written below the 6 in the product.

			2	8	
			x	7	
			<hr/>		
		1	9	6	
				5	

M. 8. LONG MULTIPLICATION (5-6)

The next step from short multiplication is long multiplication. Again, reference to the grid method should be used to ensure conceptual understanding, e.g. because we are multiplying by two tens, the answer will be ten times bigger than if we divided by two.

A grid-based long multiplication problem. The numbers 421 and 23 are written in the top two rows. A horizontal line is drawn below the 421. The product 9683 is written in the row below the line. A plus sign is written to the left of the 8420 row.

			4	2	1	
			x	2	3	
			<hr/>			
		1	2	6	3	
	+	8	4	2	0	
		9	6	8	3	

The methods of short and long multiplication extend to decimals.

			1	6	4		
			x		2	•	7
			1	4	4	•	8
			3	2	8		
			4	4	2	•	8

DIVISION

D. 7. SHORT DIVISION (5-6)

Dienes apparatus and place-value counters are used to introduce division by grouping after partitioning (see video for a clearer explanation of this method).

$$\begin{array}{r}
 23 \\
 6 \overline{) 138} \\
 \underline{12} \\
 18 \\
 \underline{18} \\
 0
 \end{array}$$

Hundreds	Tens	Ones
		
		
		

$$964 \div 7 = 137 \text{ r}5$$

$$\begin{array}{r} 137 \text{ r}5 \\ \hline 7 \overline{) 964} \end{array}$$

D. 7. LONG DIVISION (5-6)

Standard short division does not help with the following calculation. However, it can be solved using long division (by repeated subtraction using multiples of the divisor):

$$144 \div 16 = 9$$

$$\begin{array}{r}
 9 \\
 16 \overline{) 144} \\
 \underline{- 64} \quad (4 \times 16) \\
 80 \\
 \underline{- 64} \quad (4 \times 16) \\
 16 \\
 \underline{- 16} \quad (1 \times 16) \\
 0
 \end{array}$$

Multiples of the divisor (16) have been subtracted from the dividend (144)

'4 (lots of 16) + 4 (lots of 16) + 1 (lot of 16) = 9 (lots of 16)

There is no remainder'

432 \div 15 becomes

$$\begin{array}{r}
 28 \text{ r } 12 \\
 15 \overline{) 432} \\
 \underline{30} \\
 132 \\
 \underline{120} \\
 12
 \end{array}$$

Answer: 28 remainder 12

432 \div 15 becomes

$$\begin{array}{r}
 28 \\
 15 \overline{) 432} \\
 \underline{30} \quad 15 \times 20 \\
 132 \\
 \underline{120} \quad 15 \times 8 \\
 12
 \end{array}$$

$$\frac{12}{15} = \frac{4}{5}$$

Answer: $28 \frac{4}{5}$

432 \div 15 becomes

$$\begin{array}{r}
 28.8 \\
 15 \overline{) 432.0} \\
 \underline{30} \\
 132 \\
 \underline{120} \\
 120 \\
 \underline{120} \\
 0
 \end{array}$$

Answer: 28.8

D. 9. ALTERNATIVE PRESENTATIONS OF THE REMAINDER (6)

Once children have a firm understanding of fractions and decimals, children learn to present the remainder to a division question as a fraction or a decimal.

To present the remainder as a fraction, groupings of objects can be used.

$13 \div 4 = 3 \text{ r } 1 = 3\frac{1}{4}$

One team One team One team $\frac{1}{4}$ of a team

'How many teams of four can be made from 13 people?'

Presentation of the remainder as a decimal can be done either by converting the fraction form above to a decimal, or using the extended short method for division. Place value counters (available down to 0.01) are particularly useful here.

$59 \div 4 = 14.75$

$$\begin{array}{r} 14.75 \\ 4 \overline{) 59.00} \\ \underline{4} \\ 19 \\ \underline{16} \\ 30 \\ \underline{28} \\ 20 \\ \underline{20} \\ 0 \end{array}$$
