

Fig 1 Key highlights

OVERVIEW

The annual rainy season in Nigeria occurs from April to October with the highest concentration of rainfall between June and September. During July-August 2024, hefty rains have impacted many states, resulting in significant flooding that devastated various communities. The floods caused extensive damage to infrastructure, crops, and shelters, severely affecting livelihoods and displacing many households. Climate variability and human-induced factors have exacerbated the floods in recent years, leading to increased displacement across Nigeria.

Between 4 and 8 September 2024, the Displacement Tracking Matrix (DTM), in collaboration with the National Emergency Management Agency (NEMA), the Plateau State Emergency Management Agency (SEMA) and the Nigerian Red Cross Society (NRCS), identified 8 locations in Plateau State that were impacted by floods or received internally displaced persons (IDPs) due to the flooding. Through a network of 8 key informants and field focal points, and in close coordination with other humanitarian partners and local authorities, DTM conducted assessments in these locations to provide insights to the humanitarian community on the affected population's primary needs, vulnerabilities, and mobility intentions.

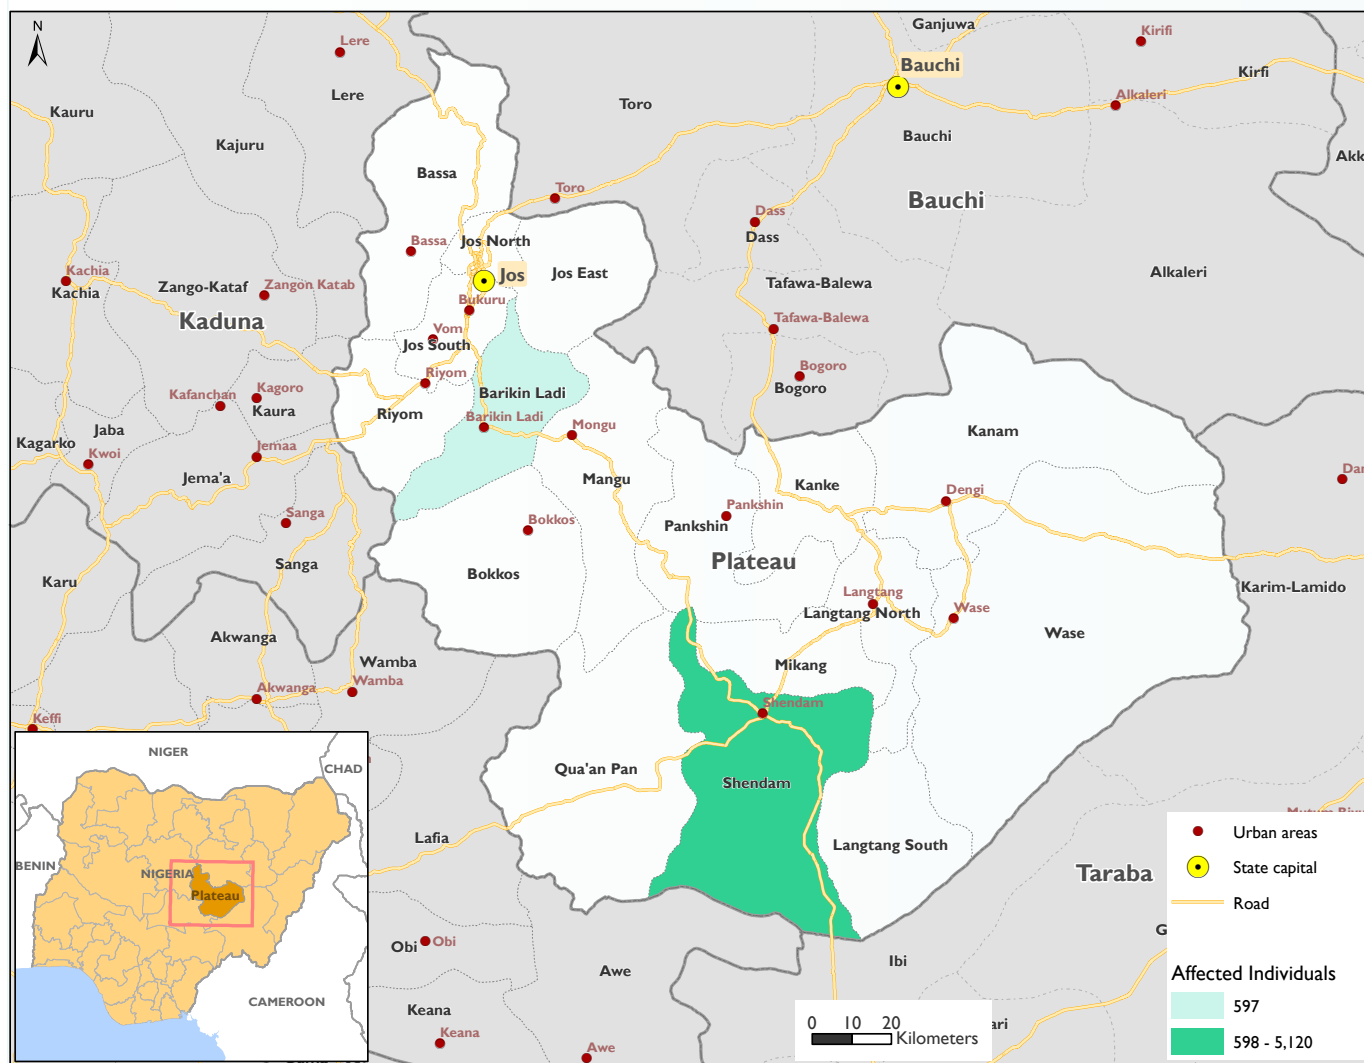

In the two local government areas (LGAs) of Plateau State that were assessed, DTM identified 5,717 individuals in 1,129 households affected by the floods. These individuals included IDPs displaced by the floods and residents impacted by the floods but remained in their communities. Twenty-nine per cent (29%) of the affected houses are habitable but need repairs, 18 per cent were partially damaged but need repairs, and 6 per cent were completely destroyed. In 88 per cent of the locations assessed, crop farming was among the primary sources of income.

METHODOLOGY

Crises and emergencies require the humanitarian community to act urgently. As a subcomponent of DTM's mobility tracking, flash reports utilise direct observation and a broad network of key informants to monitor sudden displacement resulting from disasters or attacks and collect information on the number, profile, and immediate needs of affected populations. In the initial 24 - 48 hours after an incident, DTM Nigeria activates a rapid assessment to document the event, urgent needs of affected individuals, demographic information, and impact. If displacement occurs, DTM Nigeria issues an Early Warning Flash/Incident report within 72 hours if displacement occurs, notifying partners and stakeholders.

FLOOD SITUATION REPORT — PLATEAU STATE

LGAs affected by floods

The depiction and use of boundaries, geographic names, and related data shown on maps and included in this report are not warranted to be error-free, nor do they imply a judgment on the legal status of any territory or any endorsement or acceptance of such boundaries by IOM.

Shendam recorded the highest number of individuals affected by flooding, with 5,120 people, making up 90% of the total affected population in Plateau State. Barikin Ladi followed with 597 individuals, representing 10% of the total affected population.

The flooding affected a combined total of 1,129 households and 5,717 individuals across the two listed LGAs in the state.

Fig 2 Demographic breakdown

The demographic analysis of the population affected by the flood in Plateau State highlights key groups that will require targeted assistance. Children between 1 and 17 years represent a significant portion of the population, necessitating attention to their educational, nutritional, and protection needs. As the largest group, adults (18-59 years old) are expected to play a central role in recovery efforts and may need support to regain their livelihoods. Older people, though a smaller group, remain particularly vulnerable and require special attention to health and mobility needs. The overall population consists of 55 per cent males and 45 per cent females, underscoring the need for gender-sensitive approaches to be incorporated into all aspects of the response.

KEY HIGHLIGHTS

Food was reported among the top three most urgent needs in 100 per cent of locations assessed. This may be due to disrupted food supply chains, loss of crops, and livelihood destruction due to the flooding. Food was followed by shelter in 88 per cent of locations assessed, reflecting damage to homes and displacement. Temporary shelter solutions and long-term housing rehabilitation, will be essential to support the affected population. Fifty per cent of the population, required non-food items such as blankets, clothing, cooking utensils, and hygiene products. The need for these goods suggested that the floods had caused significant material losses, leaving many without the basic necessities for daily living.

Twenty-five percent of the locations assessed indicated a need for psychosocial support, while education and water and sanitation were each reported as needed in 13 per cent of locations. Although the demand for health services was notably low, this could reflect the population's focus on more immediate needs, such as food, shelter, and non-food items, following the flooding.

The need for psychosocial support underscores the importance of addressing the mental health and emotional well-being of the affected population, likely due to the trauma caused by the impact of the floods on their lives and properties. Addressing health, psychosocial, and educational needs will be vital as basic needs are met and recovery efforts progress.

In conclusion, it was reported that the most pressing needs were food, shelter, non-food items, psychosocial support, education as well as water and sanitation, all of which require immediate attention. Efforts to address these areas will be critical in stabilising the affected communities and helping them recover from the impacts of the floods.

Fig 3 Top most urgent needs (multiple responses)

VULNERABILITY

Diverse vulnerabilities were identified among the displaced population. Pregnant women (46 individuals), breastfeeding mothers (262 individuals), the elderly (397 individuals), and people with chronic illnesses (29 individuals) required immediate and sustained access to healthcare services. These individuals faced significant health risks in displacement settings, where access to healthcare services may be limited, and living conditions could exacerbate pre-existing conditions. Orphaned minors (33 individuals) need protection services to ensure their safety and well-being.

IMPACT AND GAPS

Livelihood

The breakdown of income sources for the affected population, highlighted a significant reliance on crop and vegetable farming, which represented 88 per cent of the locations assessed. Agriculture, particularly crop and vegetable farming, was the dominant livelihood activity for most individuals in the assessed locations in Plateau State. Casual labour, recorded in 13 per cent of the locations, suggested that a small portion of the population is engaged in this work.
