**Director of Quality Services
at Ada Health**

1) How I view quality

(and my view on the testing's relationship with quality?)

2) Testing beyond software

(8 perspectives of quality across the SDLC)

3) Your role in testing and quality

(evolving into Quality Engineering)

1) What is Quality?

Definitions of “Quality”?

Dictionary.com definitions

quality

[kwol-i-tee] [SHOW IPA](#) [SEE MORE SYNONYMS](#)

SYNONYMS | EXAMPLES | WORD ORIGIN

noun, plural qual-i-ties.

- 1 an essential or distinctive characteristic, property, or attribute:
the chemical qualities of alcohol.
- 2 character or nature, as belonging to or distinguishing a thing:
the quality of a sound.
- 3 character with respect to fineness, or grade of excellence:
food of poor quality; silks of fine quality.
- 4 high grade; superiority; excellence:
wood grain of quality.

Software quality

From Wikipedia, the free encyclopedia

In the context of [software engineering](#), **software quality** refers to two related but distinct notions:

- Software functional quality reflects how well it complies with or **conforms to a given design, based on functional requirements or specifications**. That attribute can also be described as the **fitness for purpose** of a piece of software or how it compares to competitors in the marketplace as a worthwhile **product**.^[1] It is the degree to which the correct software was produced.
- Software structural quality refers to how it meets **non-functional requirements** that support the delivery of the functional requirements, such as robustness or maintainability. It has a lot more to do with the degree to which the **software works as needed**.

Quality is “value to some person(s)” (Weinberg), to which James Bach and I add “who matter”.

Definitions of “Quality”?

Definitions of “Quality”?

Excellence, Fineness, goodness...

fineness, or grade of excellence:

high grade; superiority; excellence:

Value, perspective...

value to some person

Conformance, Correctness, Works, Fitness, Purpose...

conforms to a given design,

conformance to specified requirements

fitness for purpose

correct software

software works

who matter”.

Testing Activities Relating to the 8 Perspectives

Information from testing here helps us improve these leading quality indicators...

...Which improves the trailing quality indicators discovered from our testing here

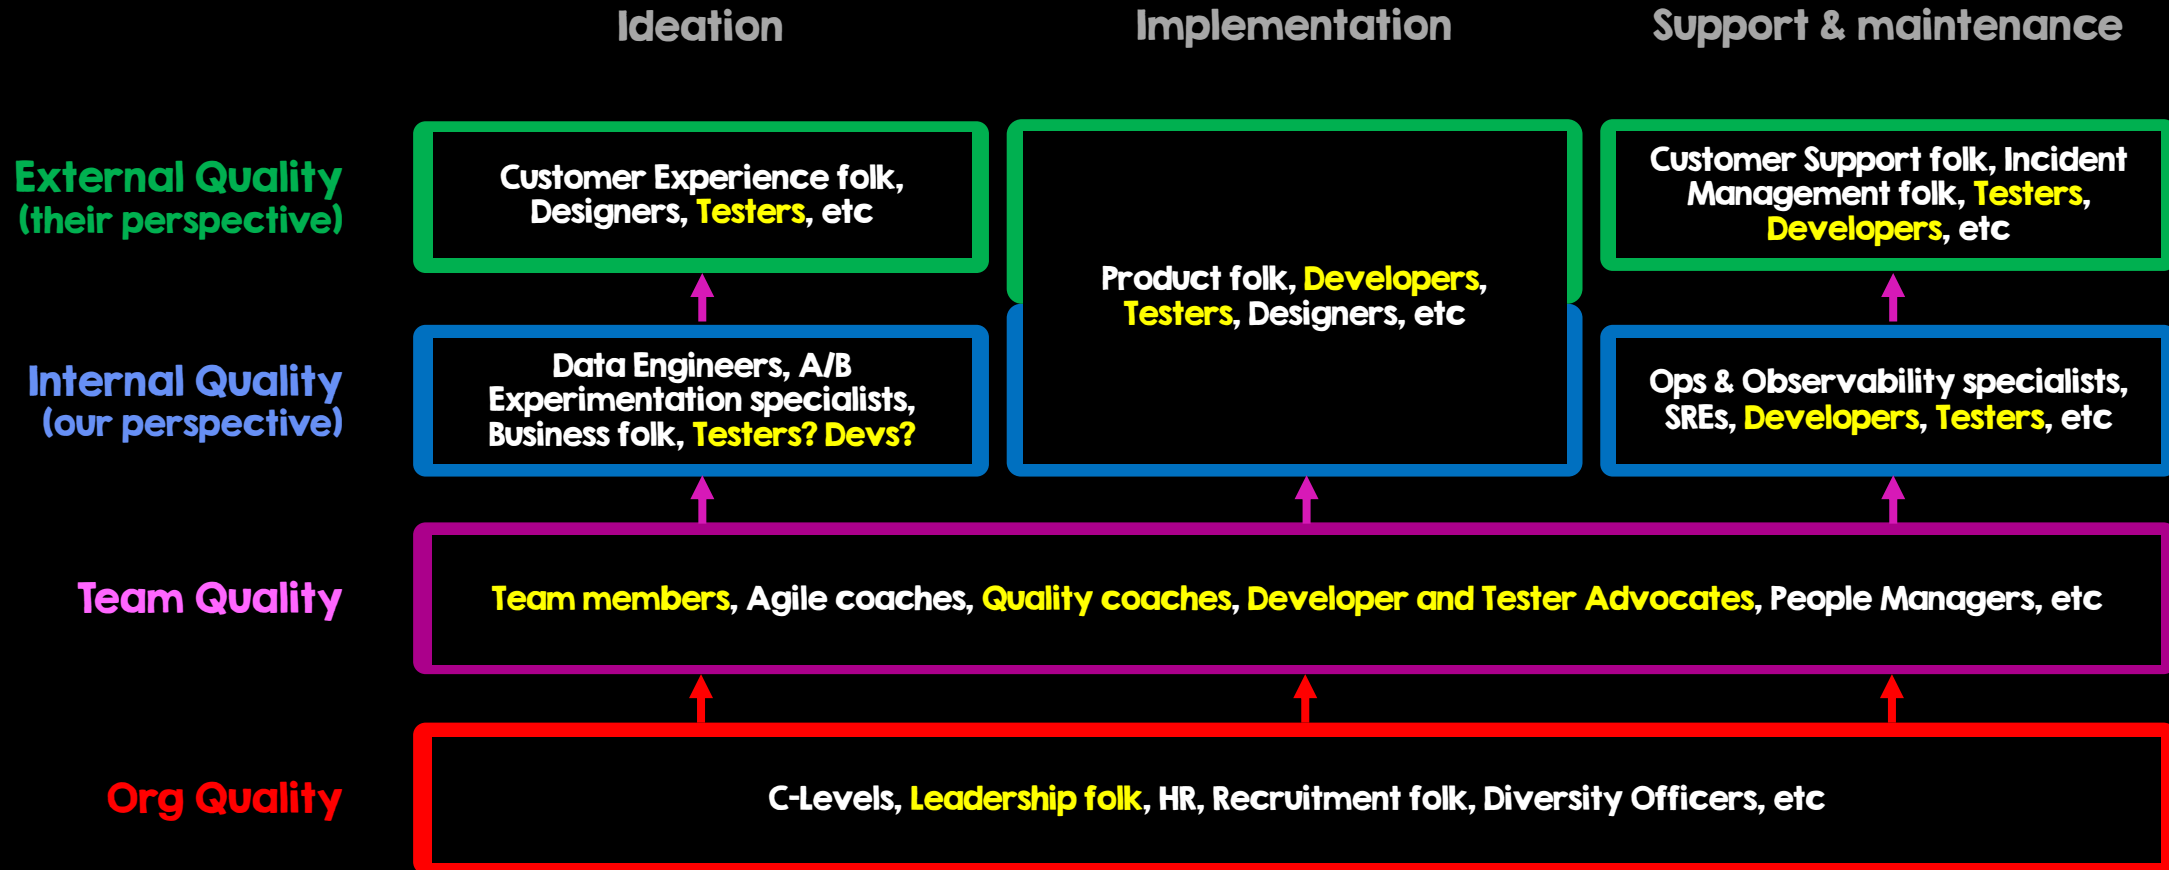

3) What's *YOUR* role in testing and quality?

Roles & Responsibilities Relating to the 8 Perspectives

Roles & Responsibilities Relating to the 8 Perspectives

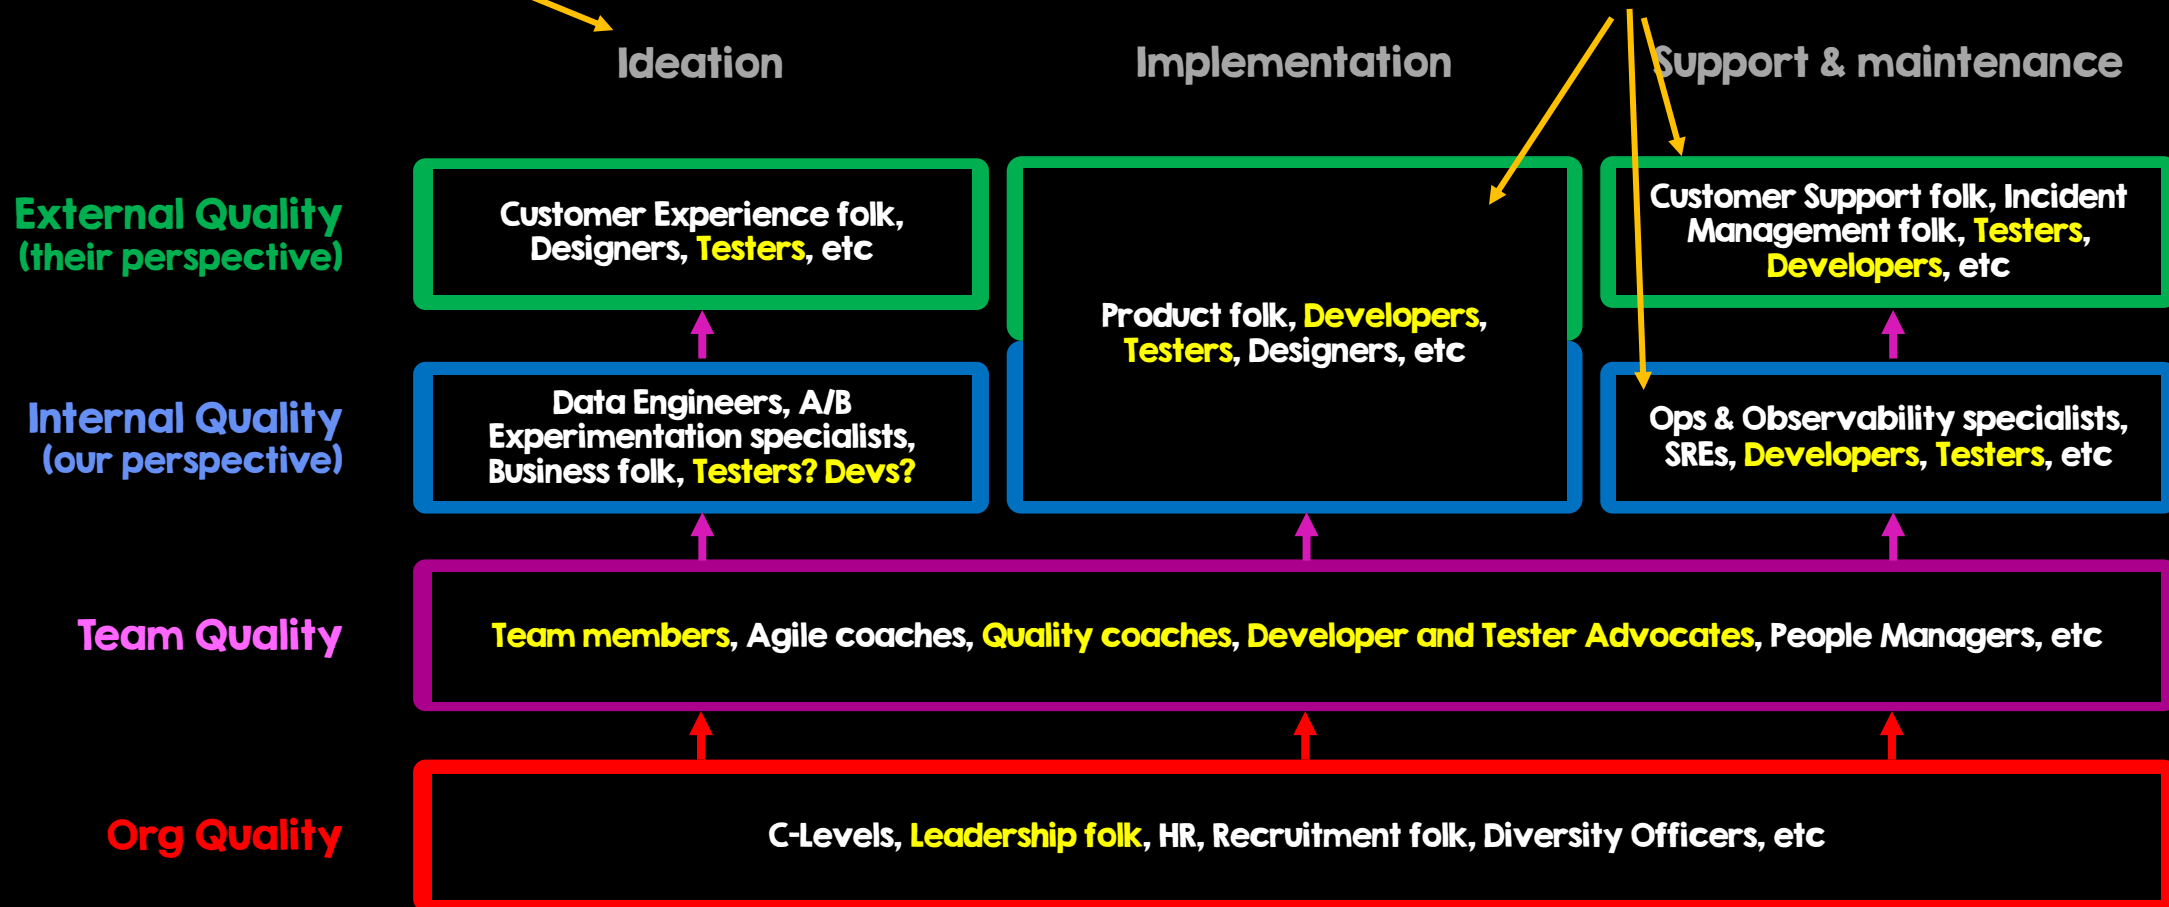

Are you evolving your testing into the other boxes?

Roles & Responsibilities Relating to the 8 Perspectives

Bringing your testing skills earlier in the process...

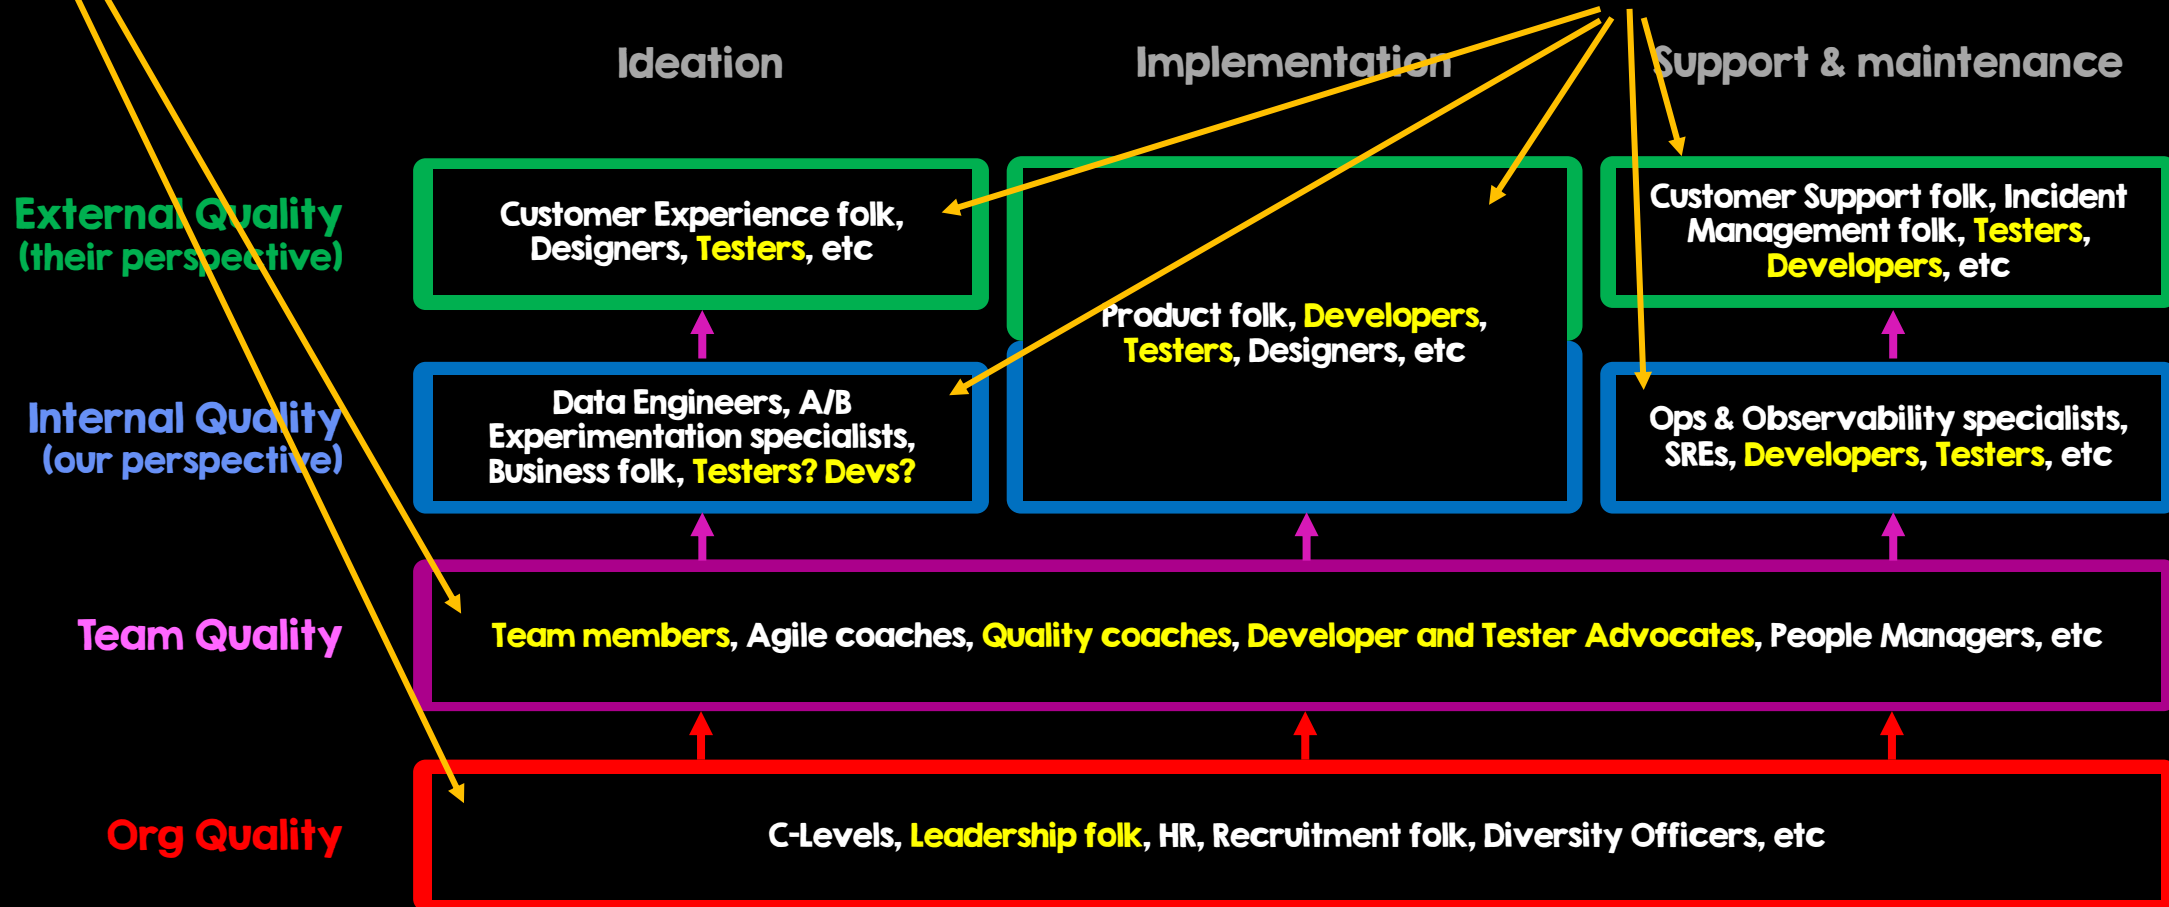

...Helps to prevent problems in the product

Roles & Responsibilities Relating to the 8 Perspectives

Expanding your testing to include team and org processes and attributes...

...Enables the improvement of quality everywhere else!

Quality Engineering

****Engineer (definition)****

Noun: An engineer; a person who constructs or creates something technical

Example: A Software Engineer, A Civil Engineer, etc

Verb: To Engineer; to arrange, manage, or carry through by skillful or artful contrivance

Example: She engineered the success of the project so well, he engineered the election campaign

To Engineer Quality (verb) is to: skillfully contrive, organize and influence quality into a product proactively, through involvement throughout the whole product lifecycle

Testers make great Quality Engineers, because of our existing skills in assessing quality

**Go forth and
engineer
quality
by evolving
your testing**

Thank you!

“I like the new desktop browser view”

“You shouldn't have gotten rid of this feature...”

“Here's an idea - I would really like this”

“This is so unusable. It's causing me so much despair! ☹️”

ALL SOFTWARE STARTS
WITH AN IDEA...

All software starts with a small piece of info...

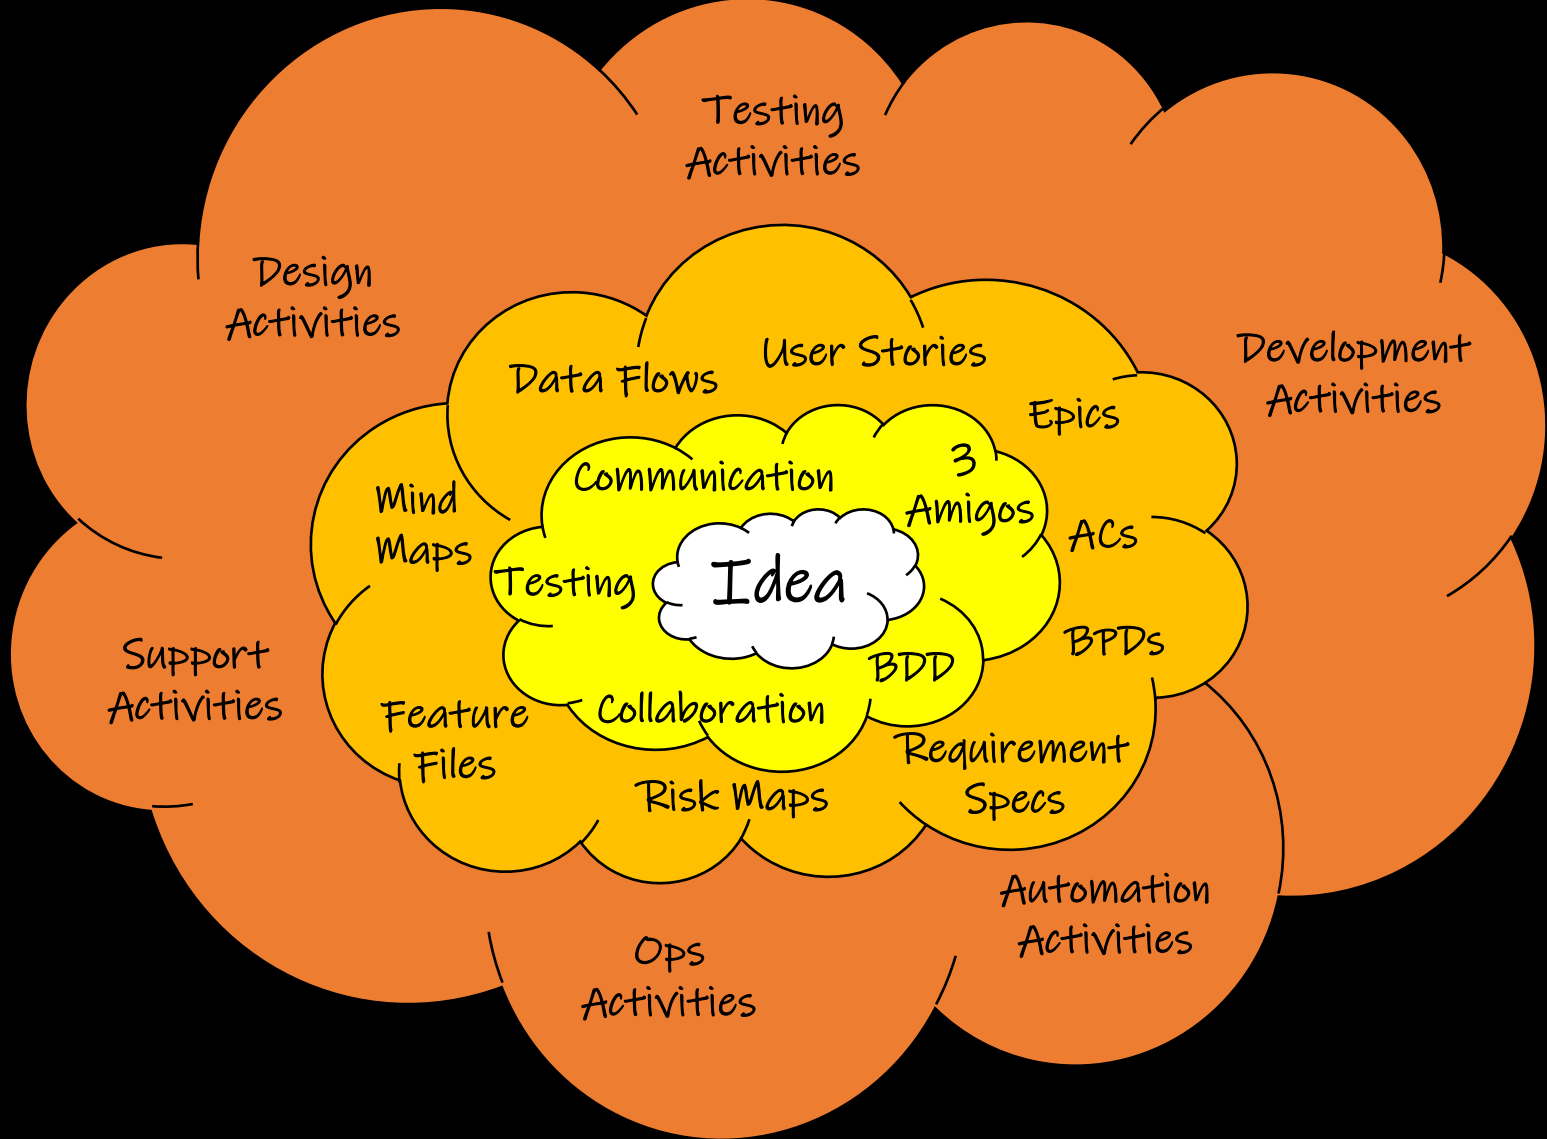

We put processes and activities in place to investigate and evaluate that info...

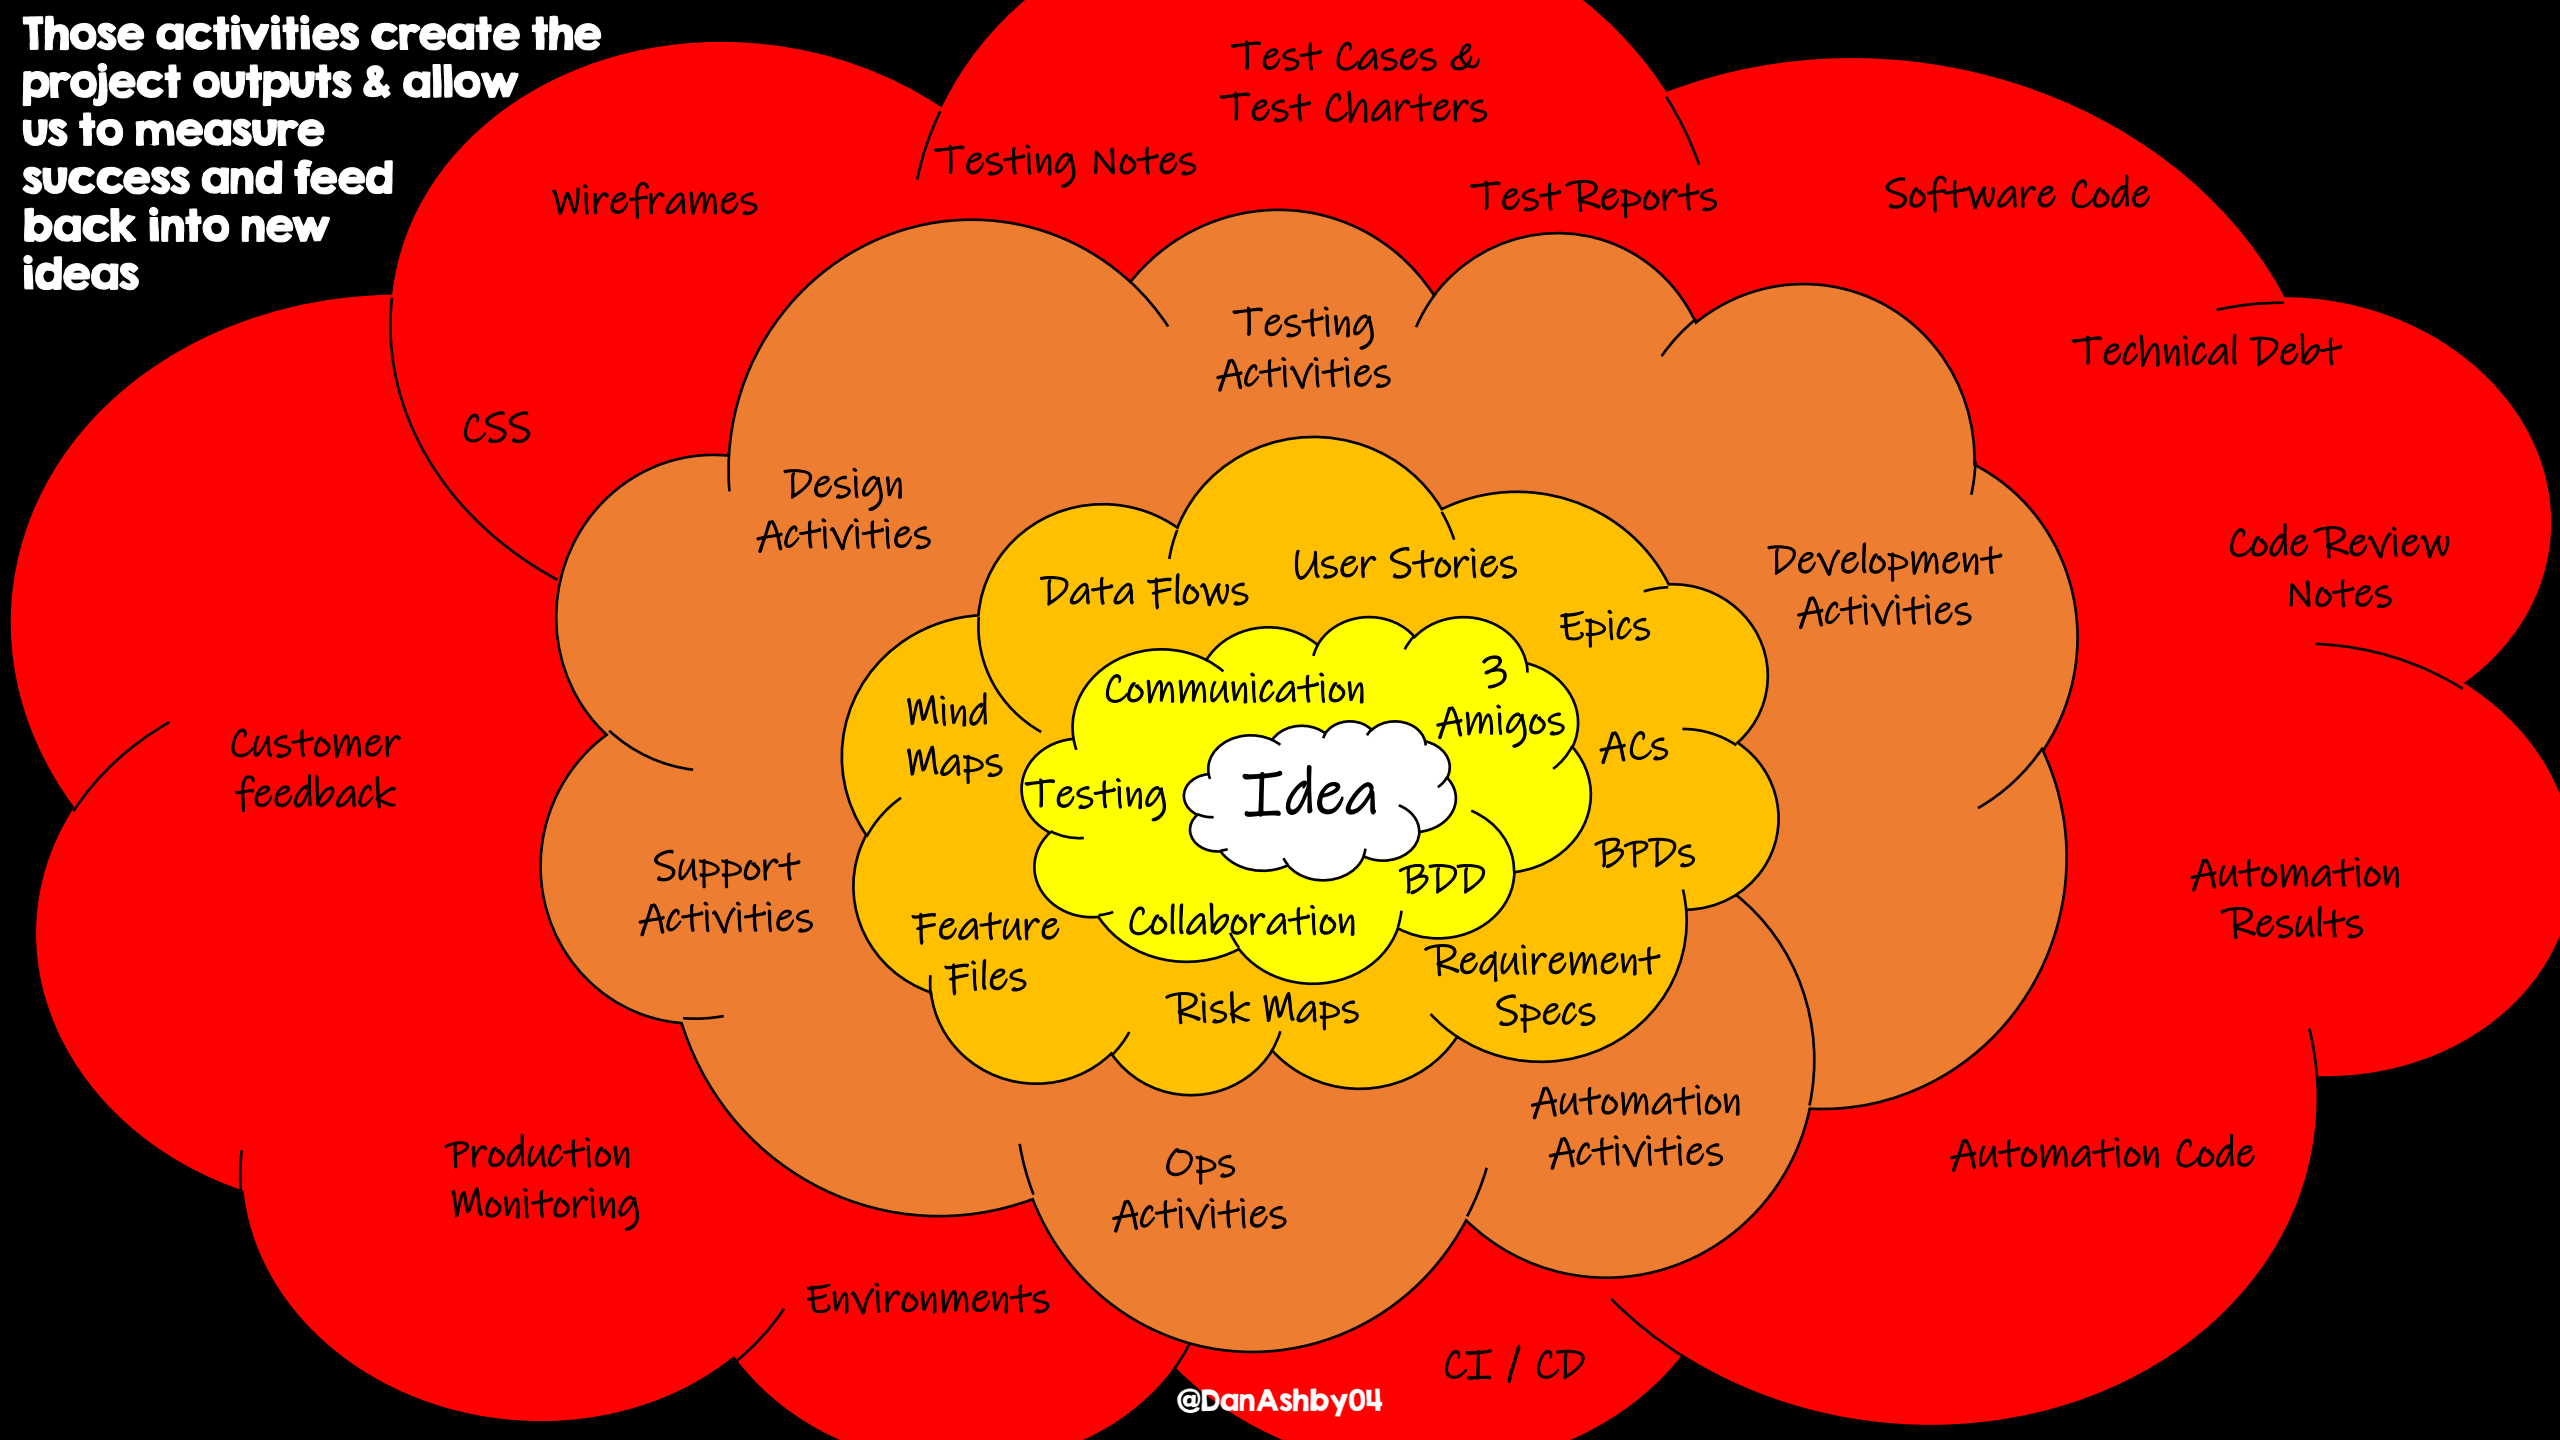

That investigation allows us to form more artefacts with more info...

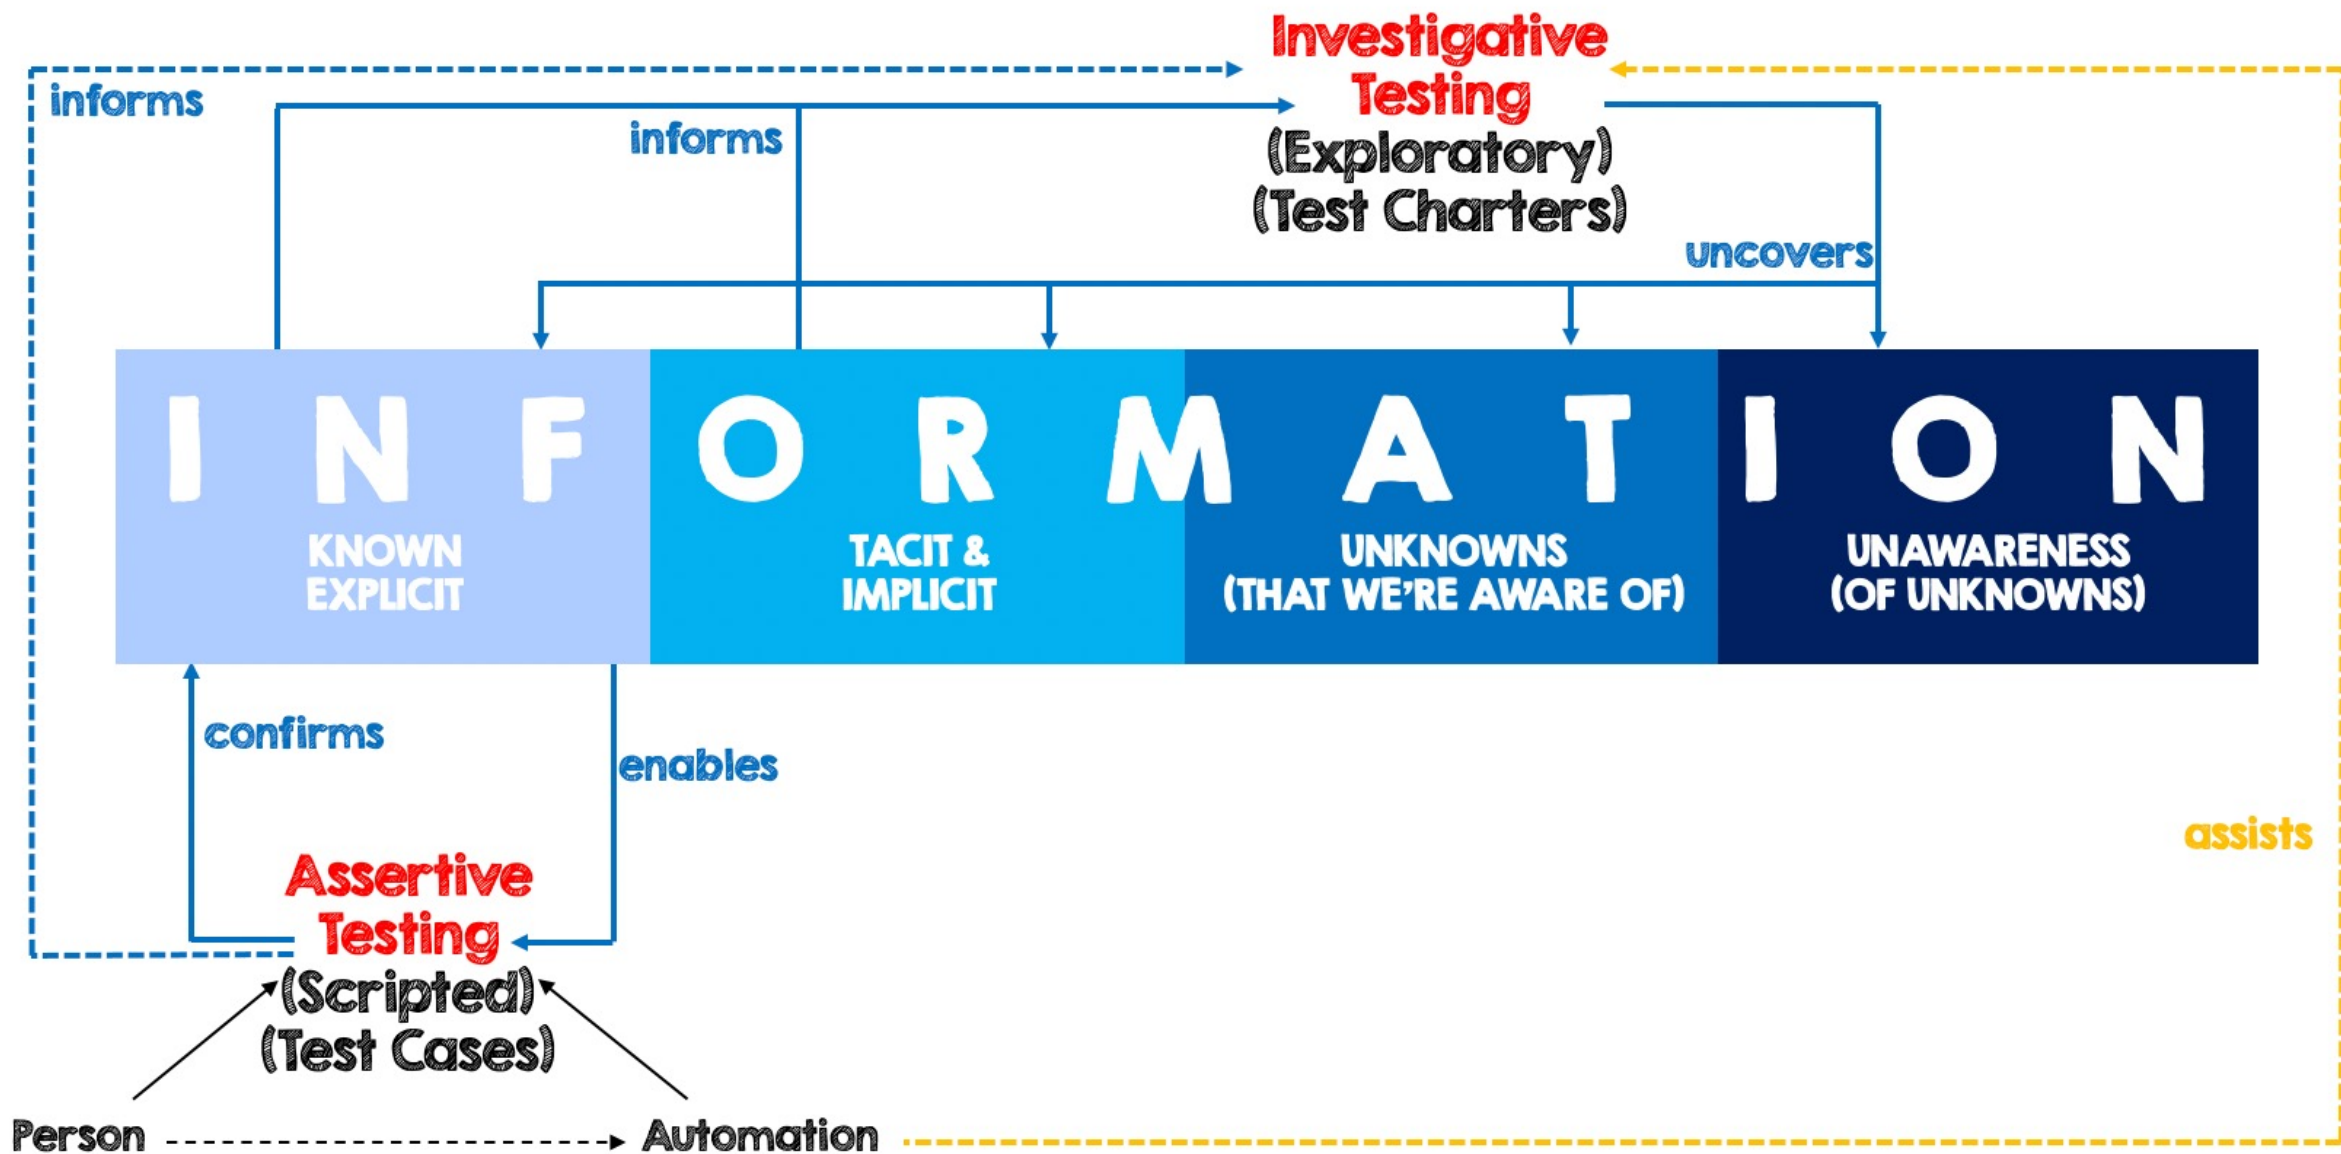

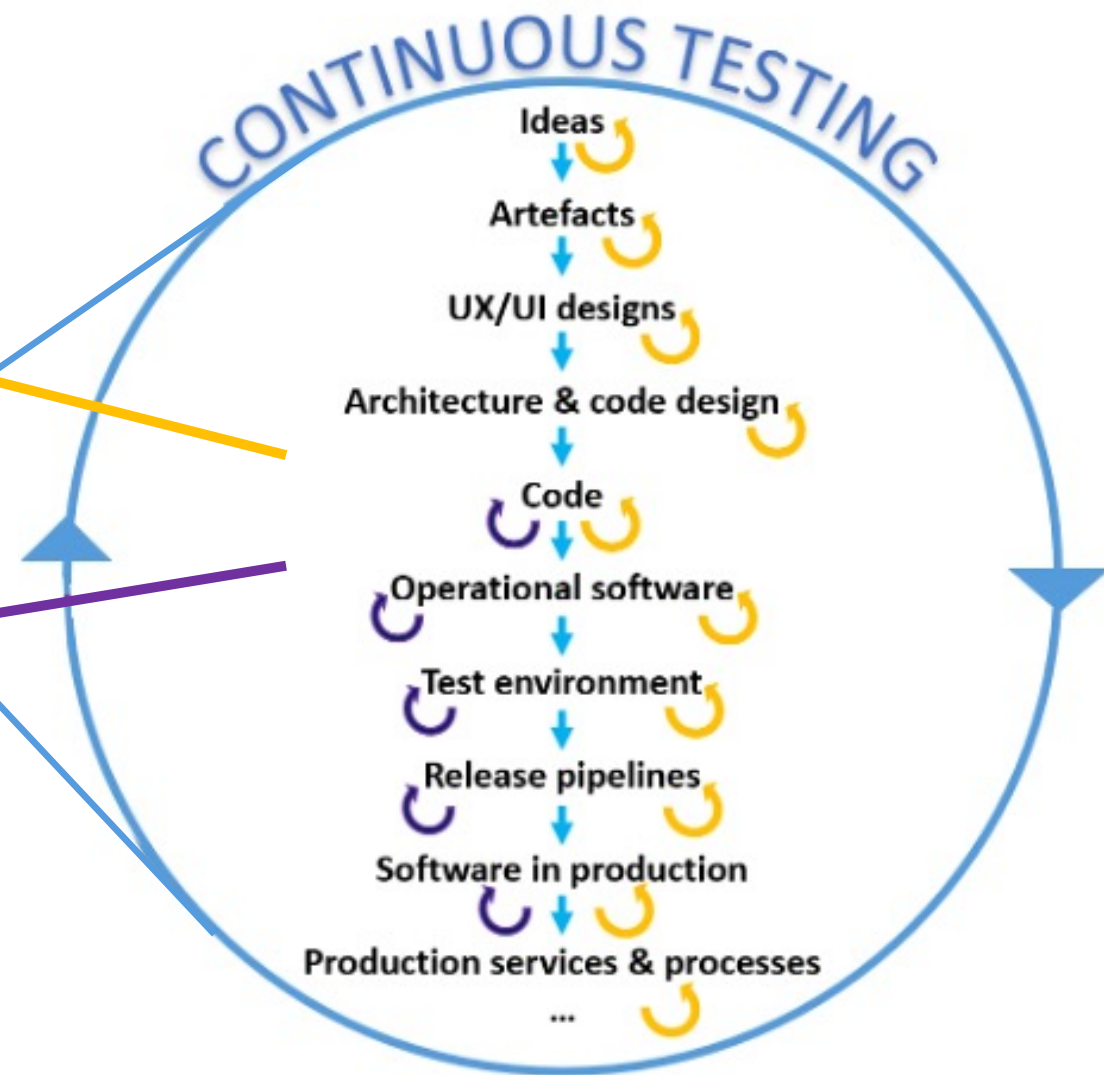

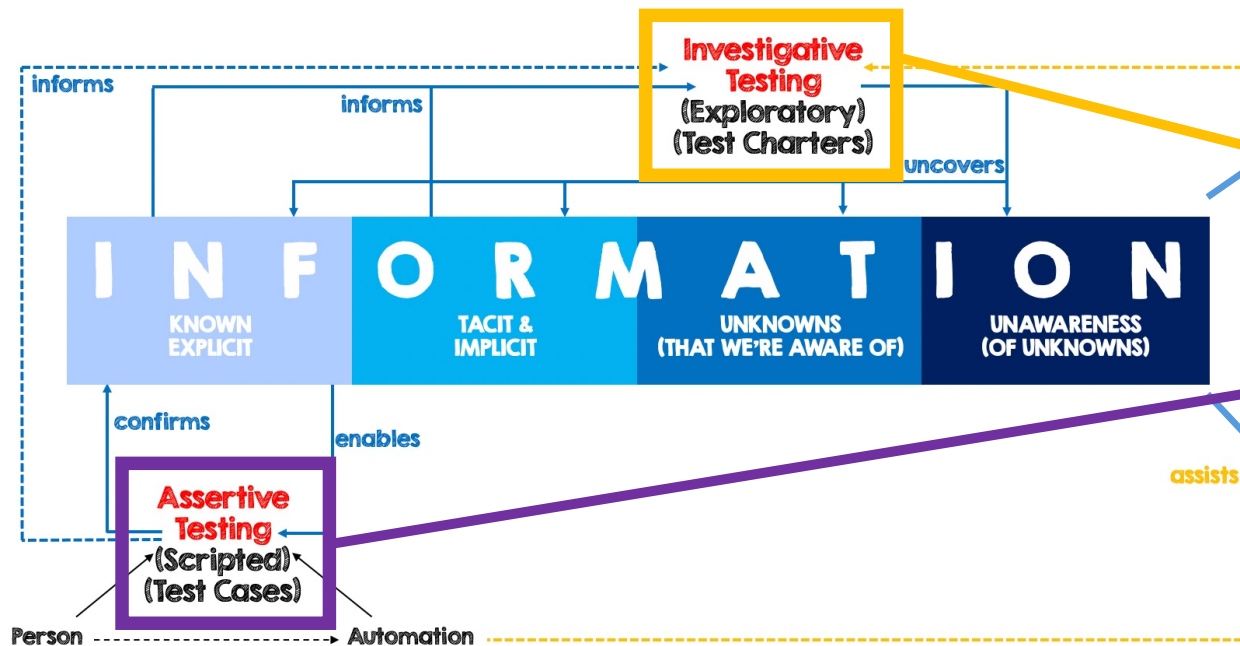

Those artefacts containing more info can then be used to stem other activities...

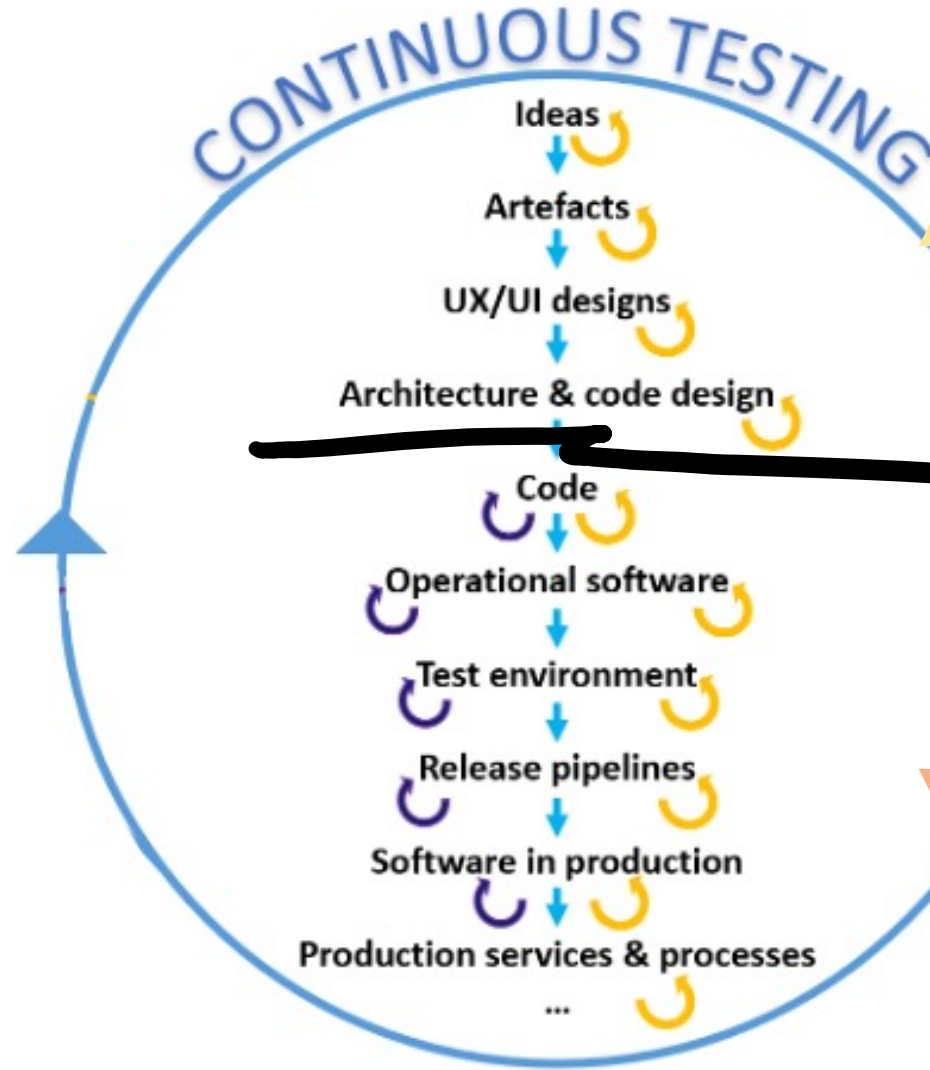

Those activities create the project outputs & allow us to measure success and feed back into new ideas

Investigating ideas and designs to uncover risks, variables and unknowns to feed design and prevent problems proactively

Investigating risks and unknowns in the software to uncover problems and info to be able to respond and fix reactively
