### Thermopeel MRF

ThermoPeel is basically an accelerated form of exfoliation done by means of a mechanical peeling on the skin surface.

The exfoliation, or removal of our skin, takes place on a daily basis like any other cellular process.

The time necessary for our cells to complete a renewal cycle and migrate to the stratum corneum is about 16/20 days.

Unfortunately, ageing, health issues and pollution play an important role in making the skin cellular renewal process take longer and longer.

Depending on the depth of the exfoliation, ThermoPeel is able to either remove just the superficial layers of dead cells or reach down to the living cells of the skin and the dermis. Moreover, using a bipolar radio frequency hand-piece, it can reach deeply into the dermis, causing an even heating of the tissue and stimulating the production of new collagen and elastin.

ThermoPeel is a totally non-invasive technology and a revolutionary technique for skin rejuvenation and regeneration, especially designed to correct:

- **Superficial and deep skin imperfections**
- **Superficial and deep wrinkles**
- **"Crow's feet" around the eyes**
- **Wrinkles on the forehead and frown line**
- **Fine lines around the mouth.**

***This technique can actively treat acne scars, blemishes and stretch marks as well.***

- 1. What is the function of the ThermoPeel treatment?***
- 2. How long has this method been on the market for?***

ThermoPeel is a revolutionary device capable of effectively treating a variety of face and body skin issues: ageing, wrinkles, acne and acne scars, stretch marks, hyperpigmentation marks and other skin imperfections.

The secret of its success lies in the combination of multiple elements within the same device, such as microdermabrasion to exfoliate the skin, infrared laser to regenerate the skin, and bipolar radio frequency to stretch the subcutaneous tissue, with subsequent renewal of collagen fibers.

Microdermabrasion uses a powerful projection of fine aluminum crystals, which remove the upper layers of the skin in a totally non-invasive and gentle procedure.

Simultaneously, an infrared laser beam penetrates into the tissue, hence stimulating cellular activity and renewal.

The treatment with bipolar radio frequency, then, causes an even heating of the tissue and stimulates the production of new collagen and elastin. It is also possible to perform a vacuum massage capable of bringing oxygen to the tissues and helping lymphatic drainage and removal of catabolites and toxins.

### **What results can I expect and in what time?**

Depending on the area and on the skin imperfection to treat, you will notice an improvement and greater brightness of the skin since the very first session.

In case of treatment of acne scars an immediate result will be less obvious.

Wrinkles and expression lines are effectively treated and show a significantly reduced appearance, combined with a softer, smoother and younger looking skin. After the first treatment the skin's colour will be red, bright, fresh.

Progressive, ongoing improvements will continue in the following sessions, for the whole duration of the treatment cycle.

The results begin to be dramatically evident starting from the third treatment

How many treatments are needed to obtain visible results?

The conditions of the skin and age of a given customer are crucial to assess the number of sessions necessary to get the best results.

The treatment of the most common issues requires a minimum of eight sessions to provide excellent results. As an effect of the treatment, the texture of the treated tissue and its surrounding area will show a dramatic improvement.

What does the skin look like immediately after the treatment and what products are needed at home?

Sometimes the skin may appear slightly red after a ThermoPeel treatment. This condition usually lasts just a few hours and sometimes a slight feeling of "sensitized skin" can last for the two days following the treatment.

In order to protect, soothe and normalize the balance of the skin it is necessary to use **Renlive - F&F cosmeceuticals**, designed to complement and enhance the effect that Thermo peel has on the biological system of the skin.  
Is the treatment painful?

The treatment with ThermoPeel is considered very pleasant and relaxing by clients.  
Does the Thermo peel treatment protocol require the cosmetic products?  
Every session includes the application of specific cosmetic formulations that enhance and complement the revitalizing and bio-stimulating effects of the Thermo peel treatment.  
These extraordinarily effective formulations are the result of the most advanced research in the cosmetic field: they contain dermatologically tested, pure, high quality ingredients, which give the skin a renewed energy and brightness. Research, development and production of the **Renlive F&F Cosmeceuticals** are carried out according to UNI EN ISO 9001 regulations.
