

CURRENT AMBAE VOLCANO ACTIVITY SAFETY MAP

07.06.2018

Legend :

- Exclusion Zone
- Danger Zone
- Dangerous Flows Zone
- Rivers :
- Rain Triggered Mud Flow
- Lakes
- Caldera
- Villages

VOLCANIC HAZARDS

Red Volcanic Gas Zone:

- Strong degassing from eruptive vents may occur, especially within the Danger Zone.

Yellow Dangerous Flows Zone:

- Parts of the Yellow Zone may be affected by flows induced from rain fall.
- Volcanic ash and debris could be remobilise down valleys during heavy rain and change the flow paths of creeks and streams.

WHAT TO DO

If you are in the Danger Zone:

- Wear gas mask or cover your noose with a cloth – it will help protect you against volcanic gases.
- Falling into the crater is also a danger, the closer you are to the edge of the crater the more chance of slipping.

Remobilisation of Volcanic Ash:

Be aware that parts of the **Yellow Zone** can be dangerous during rain fall - Avoid streams and creeks during heavy rain.

- Be prepared for volcanic gases particularly in areas within the **Red dotted-line Zone**. See Volcanic Gas, Ash and Acid Rain Key Message available from <http://www.vmgd.gov.vu>

Disclaimer

Hazard Zones are not definitive.

This map is an interpretation based on historical and geological records.

Volcanic activity may be unpredictable.
